

Procedure Risk based Antibiotic residu control (in relation to Supply Chain Inspection)

Aim:

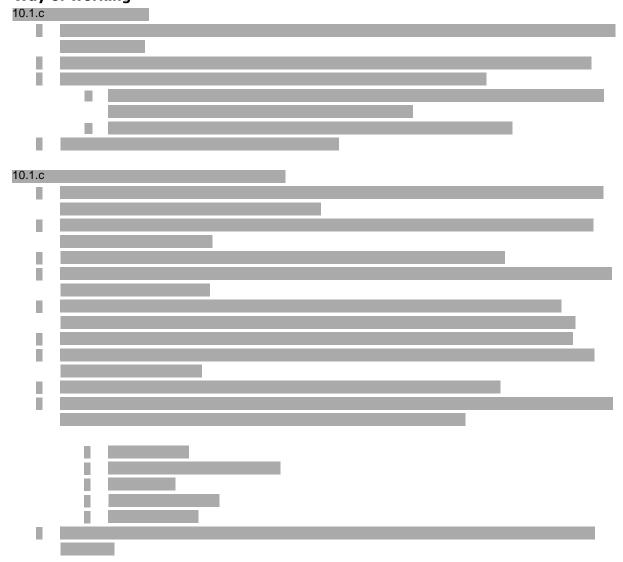

A risk based antibiotic-residu-monitoring, which is making use of relevant information out of the supply chain. Staring point is to asses (and where possible to reduce) the risks.

Background:

The antibiotic-residu-monitoring is performed based on a risk-based approach. Samples are taken on the basis of observations made during slaughtering of pigs. Higher percentages of pleuritis could be an indicator for clinical signs (coughing), and there is a higher likelihood that the animals received an antibiotic treatment. By using these observations farms can be put in a "risk group". In the case of observations during slaughtering of the pigs, the information is send to the farmer as feedback. In this way the farmer can change the management strategies on the farm to prevent problems in the next rounds of fattening pigs.

This procedure describes also the monitoring of critical substances.

Way of working

Procedure Risk based Antibiotic residu control (in relation to Supply Chain Inspection)

•	10.1.c

Monitoring:

- The execution of the sampling, will be checked on weekly base by the department management
- On weekly base, the number of planned samples will be compared with the reported results. This is the responsibility of Vion Farming

Correction:

In the case of failing to obtain a complete sample of the selected group of animals:

- If possible, sample another animal out of the same group of animals
- If this is not possible, Vion Farming needs to be notified. The next batch of the involved UBN will be sampled.

Preventive measure:

 The prevent repeaditly failing of sampling, the location is responsible to take preventive measures.

Verification:

- Whenever there is a reference to the SSOP
- Internal as part of the internal audits
- NVWA is partly responsible regarding verification of the sampling.
- Part of the NVWA audit regarding Supply Chain Inspection

Responsibility:

Execution procedure: Vion

Supervision on the execution: NVWA
