[Testing the population for Covid-20 FV.pdf](#)

Dear 5.1.2e I read with interest your joint paper on SARS-CoV-2. We are working on an End Point method which is then mass scalable using water bath PCR.

To start at the beginning we set up KBioscience which became the largest genotyping end point company in the world 1.5 million PCRs a day every day.. We eventually sold the company and retired happily. Then Covid made us look at re purposing our technology's to detect Covid and apply in mass testing..

So we have been working with UK East Kent virology pathology dept and have 100% concordant data on real Covid samples. To recap rtPCR gives you a how much Covid Virus has been detected then this is converted to a Y/N answer. Antibody testing is a Y/N answer Ebola HIV virus testing is a Y/N end point. Our question is why can't Covid or any virus be a Y/N test. In a clinical research lab rtPCR works but try doing a tens of thousands or millions per day it becomes impossible.

I would be delighted for you to see our proposal data and get your feedback.. For info we are working with BGI Beijing Genome Institute who saw the benefits immediately and looking to implement.. To be clear we are not selling anything, all info is for free public distribution, zero personal gain or any affiliations..

Many thanks
