COVID-19 and drugs: Drug supply via darknet markets

(10)(2e)

6 July 2020
HDG online meeting

Drug markets and darknet

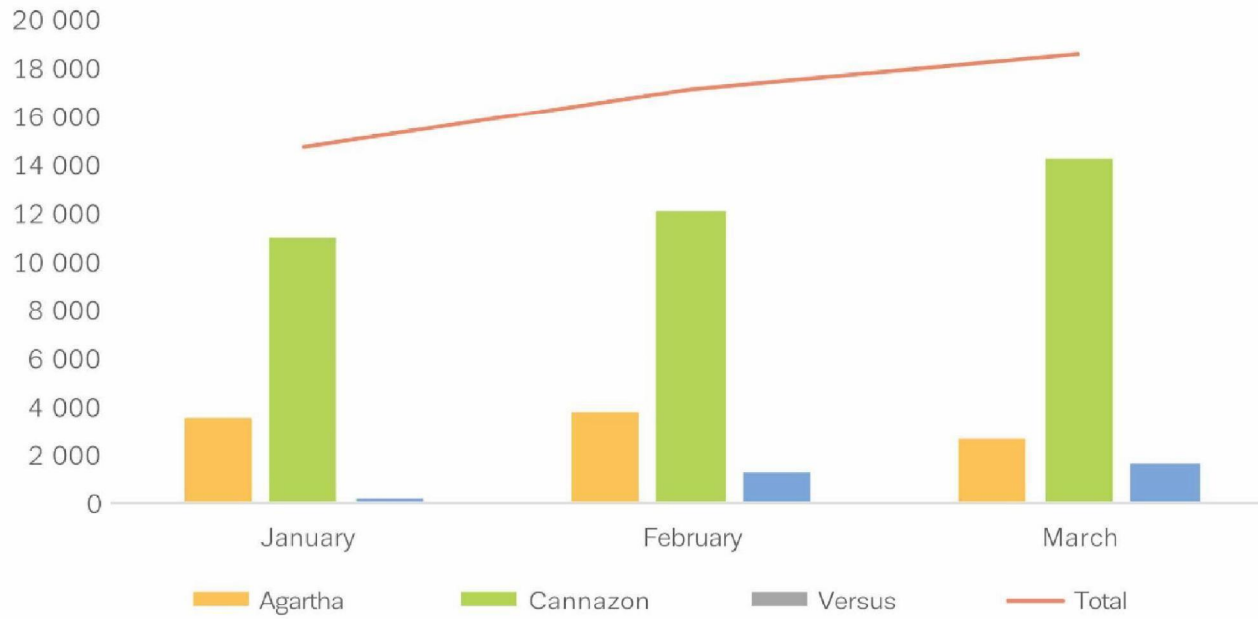

Methods: quantitative and qualitative data

- Regular crawls collected from 3 major markets and 8 discussion forums
- Quantitative data: 50 475 reviews
- Qualitative data: over 800 posts from online forums
- 1 January – 31 March 2020
- No causal relationship implied
- Allowed analysis of activity; estimation of volumes and value of cannabis; emerging themes

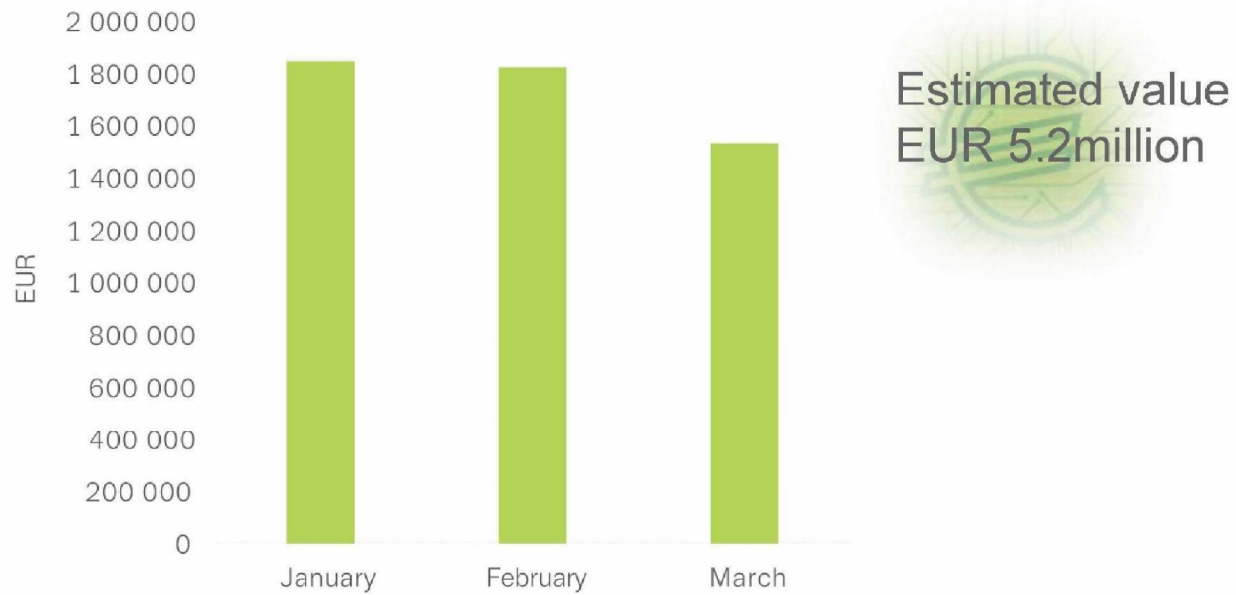

Rapid and preliminary analysis of the impact of COVID-19 on selected darknet markets

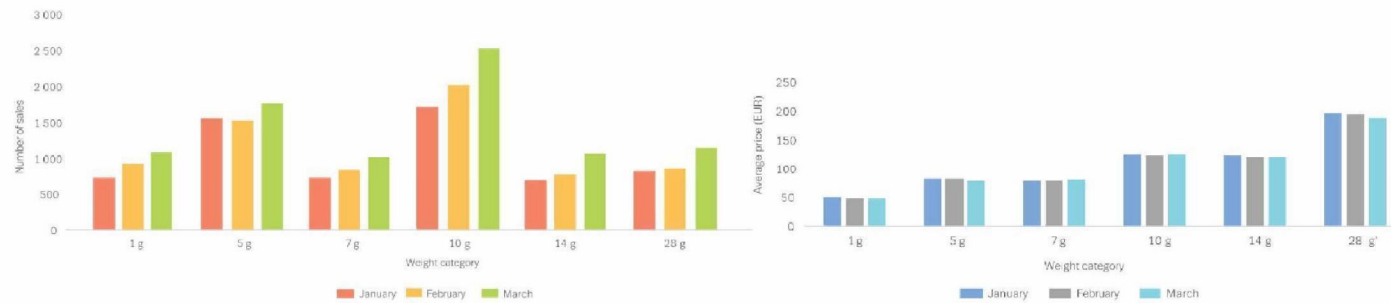

Number of drug-related reviews, January-March 2020

Monthly value of cannabis products, Cannazon January-March 2020

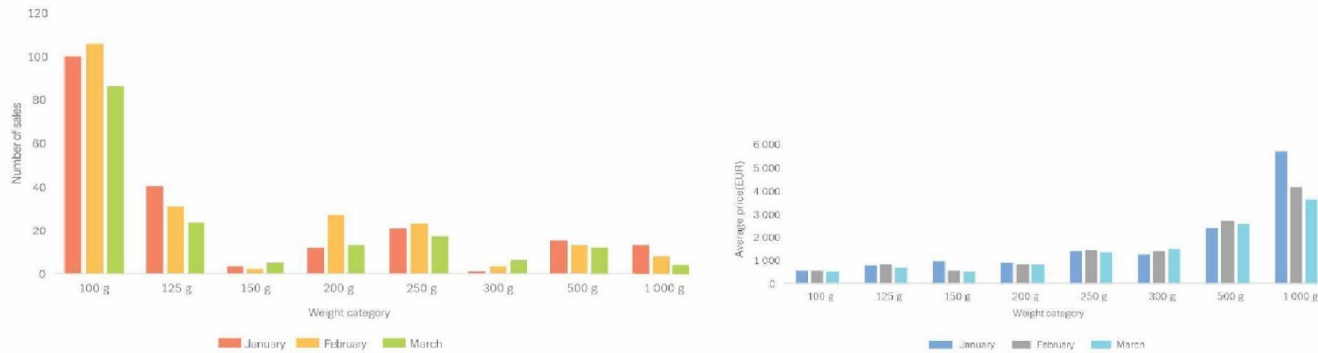

Number of sales for common retail-level weight categories, Cannazon, January-March 2020

- Increased activity of established and possibly new buyers purchasing for personal use
- Stable prices observed for these weight categories

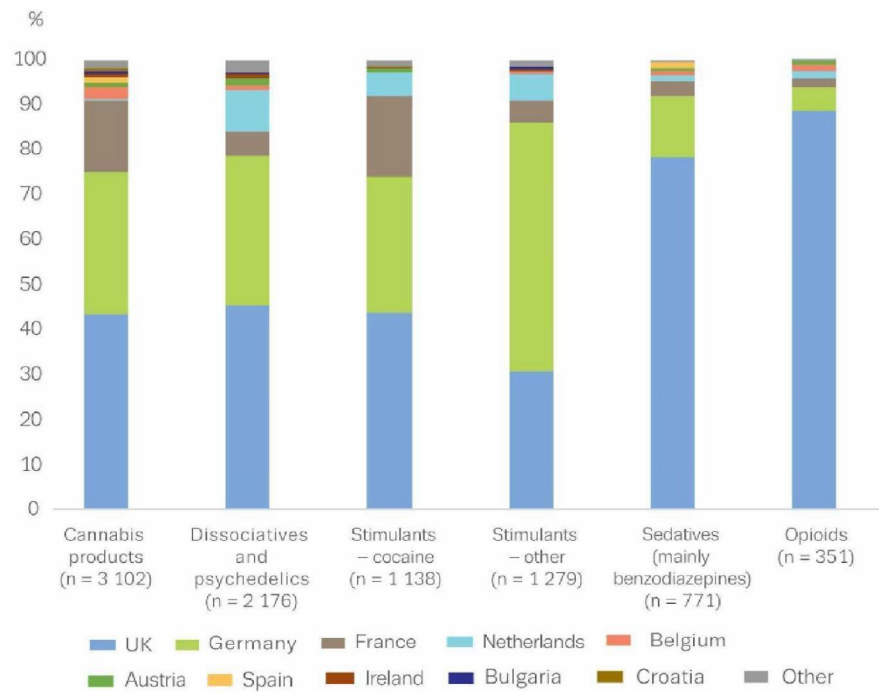

Number of sales for large weight categories, Cannazon, January-March 2020

- Purchases of resale volumes decline reflecting anticipated resale difficulties due to the social distancing measures
- Cannabis prices appear to be decreasing for large volume purchases

Main drug categories by reported shipping origin, Agatha, January-March 2020

Conclusions

- Early conclusions based mostly on observations from cannabis sales
- Cannabis data suggestive of two competing but related responses to the pandemic: those buying cannabis for physical re-sale reducing their activity, anticipating resale may be more difficult; established (or possibly new) buyers seeking cannabis for personal use increasing their activities on the market
- If the increase in darknet sales represents new users turning to this method of buying drugs, it may have consequences for the darknet market share in future
