Hi all,

I don't have my laptop with me at the moment but supplying all the info I have:

- It fails with error domain 5, the same error we've been seeing as before.
- The console app shows the same errors as I've shared before. Something along the lines unable to fetch configuration for the bundle identifier / region identifier combination.
- we've validated on 3 different iPhones. All on iOS 13.6.

Best,
